V VENTUREQUEST AI

PROJECTBRIEF

ventures. Learning by doing.

A global AI crowdfunding and venture simulator that helps builders shape startup ideas, explore a fictional innovation market, and try optional PayPal Sandbox checkout.

VentureQuest makes early venture-building approachable: get structured coaching, test assumptions in a simulated market, and see how a user-approved test payment can update a game experience.

AI co-founder

Local Ollama model when available; transparent built-in coach otherwise.

Interactive market

Venture pitches, scenario experiments, and an optional 3D innovation district.

PayPal Sandbox

Optional user-approved test checkout, server-side capture, and verified event flow.

01 / THE EXPERIENCE

From raw idea to a testable pitch

01

VentureQuest combines practical venture prompts with a playful simulation. Builders can move from an idea to a structured pitch without needing a paid AI account, real investment data, or a payment to try the core experience.

1

Build

Describe a problem, audience, solution, category, and sustainability model. Get a feasibility review with strengths, risks, and a suggested first experiment.

2

Explore

Publish a draft to the simulated market, compare venture cards, test 90-day what-if scenarios, or visit the Three.js innovation district.

3

Signal

Record a no-payment demo signal or, when configured, approve PayPal Sandbox Checkout. A confirmed capture updates the demo state.

> **Core idea:** turn early-stage entrepreneurship into a guided learning loop: articulate a value proposition, expose assumptions, and choose a next experiment.

What judges can explore

AI venture coach
Drafts a value proposition, target user, business-model hypothesis, short pitch, and first experiment.

Pitch Arena
Listen to a browser-spoken pitch, ask founder questions, and explore a fictional agent negotiation.

Scenario simulation
Compare community tailwind, steady-market, and competitor-pressure assumptions with experiment plans.

Virtual innovation city
Move through a browser-based 3D district, meet founders, and trigger fictional market stress events.

Venture comparison
Browse cards or use an optional sortable, filterable AG Grid Community table.

Payment event loop
A completed Sandbox capture can update the signal and show a local supporter badge in that browser.

02 / HOW IT WORKS

Local-first AI. Sandbox-only payments.

02

Suggested judge walkthrough

1. **Start a venture.** Enter a sample idea and select Coach my idea.
2. **Review the coaching.** Inspect the draft, simulated score, strengths, risks, and suggested experiment.
3. **Publish and compare.** Add the venture to the simulated market, open its pitch, and try a scenario.
4. **Visit the city.** Open Enter 3D district, meet a founder, and run a fictional crisis event.
5. **Try the signal.** Use the no-payment signal, or optional Sandbox Checkout if it is enabled on the host.

Try it without credentials

The built-in coach and points-only demo signal keep the main walkthrough available without PayPal credentials or an AI API key. The 3D page requires WebGL and a network connection for its renderer.

Technology & integrations

AI	Ollama + Qwen2.5 1.5B can run locally for drafting, founder Q&A, and fictional event narration. A heuristic/contextual fallback keeps the demo usable without a model.
PayPal	JavaScript SDK v6 with Orders REST API v2 for optional Sandbox Checkout and server-side capture. Live payments are not enabled.
Webhooks	Optional signature verification for Sandbox capture events, with Server-Sent Events to update open browser sessions.
Runtime	Dependency-free Node.js HTTP server with browser-native HTML, CSS, and JavaScript. No build step or database required.
Additional tools	Three.js for the optional 3D world; AG Grid Community for venture comparison; Postman collection for API testing; Render for hosting.

Payment clarity: Checkout requires user approval and is a test transaction. The optional fixed USD $1 Sandbox award is operator-triggered and is not an investor dividend, return, or crisis-event payout.

03 / SCOPE & ACCESS

A learning prototype, not a financial product.

03

The simulation is intentionally framed as a learning tool. Its scores and scenarios are prompts for discussion and experimentation—not evidence, predictions, or financial advice.

What is implemented

- AI-assisted venture drafting and feasibility feedback with a local fallback.
- Simulated venture market, pitch details, comparison, scenario experiments, and local experiment log.
- Optional PayPal Sandbox order, capture, webhook verification, and real-time demo updates.
- Optional 3D district, founder interactions, browser speech, and fictional market events.

Current boundaries

- No real crowdfunding, ownership, securities, lending, investment advice, ROI, or yield.
- Market examples, scores, impacts, maps, bots, and coin effects are fictional or illustrative.
- Venture data and badges are local to the browser; there is no shared database, login, or multiplayer sync.
- Ollama and hosted PayPal Checkout depend on their respective local or server-side configuration.

Quick access

Judge access: no login is required for the points-only demo. Optional PayPal Sandbox Checkout may not be enabled on the hosted demo.

Product direction

Next steps could include shared demo data, clearer explanations of AI feedback, an event history, guided sample ventures, and an opt-in multiplayer city.

These are future ideas, not features of the current prototype. Any real-money fundraising or payout product would need a separate legal, compliance, fraud, and payment design review.

> **Thank you.** VentureQuest invites people to learn entrepreneurship by making assumptions visible and testing what to do next.
